EDUCATION

Bachelor of Science in Computer Engineering

Polytechnic University of the Philippines
2019-2023

CERTIFICATION

Consistent Achiever Award

SBC Simplified Business Consultancy
December 20, 2024

Awarded by SBC Simplified Business Consultancy on December 20, 2024, in recognition of exceptional commitment to meeting deadlines and delivering results with punctuality. Demonstrated unwavering dedication to timeliness, ensuring the smooth execution of projects and exemplifying reliability.

PROFILE

Dedicated System Developer with experience in building and improving ERP systems using ASP.NET Core Web API and Blazor WebAssembly. Skilled in using best practices, such as SOLID principles, DRY, and design patterns, to create high-quality and easy-to-maintain software. Experienced in developing user-friendly interfaces with MudBlazor and managing data with MSSQL and Entity Framework Core. Strong collaborator, using Git for version control to ensure smooth project delivery. Committed to driving efficiency and innovation through reliable, scalable solutions that meet business needs.

EMPLOYMENT HISTORY

System Developer

SBC Simplified Business Consultancy

March 2025 - Present

- Lead development of larger and more complex full-stack ERP systems tailored to diverse client business models using ASP.NET Core Web API and Blazor WebAssembly.
- Designed and implemented advanced system modules such as multi-branch inventory, payroll automation, HRIS, and analytics dashboards.
- Ensured seamless client-server communication through RESTful APIs and efficient data handling using LINQ and Entity Framework Core.
- Collaborated closely with stakeholders to define technical requirements, manage timelines, and adjust scope based on evolving business needs.
- Took initiative in maintaining code quality through application of Repository Pattern, SOLID principles, and DRY methodology.
- Oversaw Git-based workflows for version control, code reviews, and team collaboration across multiple parallel projects.
- Actively participated in client presentations and sprint reviews, offering technical insights and aligning deliverables with business goals.
- Supported deployment preparations and provided post-launch maintenance, optimizing performance and ensuring system reliability at scale.
- Continued professional development by researching architectural improvements and staying updated with the latest in .NET and Blazor technologies.

L2 Junior Developer

SBC Simplified Business Consultancy

September 2024 - March 2025

- Developed full-stack ERP systems to meet client business needs, using ASP.NET Core Web API and Blazor WebAssembly to simplify business processes.
- Integrated payment gateway APIs to enable smooth online transactions.
- Collaborated with team members to discuss project plans, structure, and features, ensuring effective use of Git for version control.
- Presented system updates and progress to clients, addressing their requirements and concerns.
- Participated in client meetings to gather feedback and refine project scope.
- Maintained and updated systems based on client requests and issue resolutions.
- Researched new techniques and optimizations to improve system performance and features.

Junior Developer

SBC Simplified Business Consultancy

March 2024 - September 2024

- Developed full-stack ERP systems using ASP.NET Core Web API and Blazor WebAssembly to streamline client business operations.
- Integrated OpenAI API for automation features, enhancing system functionality.
- Implemented SignalR for real-time communication features within projects.
- Collaborated with the team to plan and structure projects, utilizing Git for smooth version control and project development.
- Presented system updates and progress to clients, aligning with their evolving business needs.
- Engaged with clients to gather requirements and provide ongoing support for system adjustments and issue resolution.

TECHNICAL SKILLSET

C#

My primary programming language, used extensively throughout both academic and professional settings. I leverage C# to build scalable and maintainable backend systems, and it remains the language I am most proficient and comfortable with.

JavaScript

I use JavaScript not only for building interactive interfaces but also for accessing and controlling device capabilities such as the camera, geolocation, and other browser APIs.

TypeScript

I use TypeScript primarily in React development to enhance code reliability, scalability, and maintainability. Its strong typing system and object-oriented features closely resemble C# syntax, allowing me to develop frontend applications with more structure and fewer runtime errors.

ASP.NET Core

The core framework I use to develop backend services in my current role. I utilize it to create secure, modular, and high-performance APIs for enterprise-level applications.

Entity Framework Core (EF Core)

My preferred ORM for managing data access. I use EF Core to build and maintain code-first database models, perform efficient data querying, and streamline CRUD operations while maintaining database integrity.

LINQ (Language Integrated Query)

Applied heavily in database operations for filtering, joining, projecting, and manipulating data collections. LINQ allows me to write clean and expressive queries integrated directly within C# code.

RESTful APIs

Responsible for designing and consuming REST APIs to facilitate seamless client-server communication. This includes handling HTTP requests/responses, status codes, and secure data transfer protocols.

Blazor WebAssembly (WASM)

Frontend framework, which I use to develop dynamic, interactive user interfaces in C#. This allows for consistent language use across the full stack and improves maintainability.

React

React.js is one of the primary frontend frameworks I utilize for building fast, responsive, and scalable user interfaces. I typically opt for React in projects that demand optimized performance and quick initial load times, as it offers a highly efficient virtual DOM and component-based architecture.

Git

Utilized daily for version control and team collaboration. I manage branches, resolve merge conflicts, and coordinate with team members to ensure smooth integration and continuous delivery.

Microsoft SQL Server (MSSQL)

Our primary database system, where I design and manage relational database schemas, manually updating and tracking data in production in some complex cases.

Design Patterns & Best Practices

I structure backend systems using the Repository Pattern and Dependency Injection to promote separation of concerns and scalability. I also apply SOLID principles and the DRY methodology to ensure code quality, reusability, and maintainability across our ERP projects.
